perplexity

We are generating a 8-bit UART hierarchically in Verilog. We have generated BaudRateGenerator, Uart8Receiver defined as follows:

module BaudRateGenerator #(
parameter CLOCK_RATE = 100000000,
parameter BAUD_RATE = 9600,
parameter RX_OVERSAMPLE_RATE = 16
)(
input wire clk,
output reg rxClk,
output reg txClk
);

```
// Calculate clock dividers
localparam RX_DIVIDER = CLOCK_RATE / (BAUD_RATE * RX_OVERSAMPLE_RATE);
localparam TX_DIVIDER = CLOCK_RATE / BAUD_RATE;

// Counters for clock generation
reg [$clog2(RX_DIVIDER)-1:0] rxCounter = 0;
reg [$clog2(TX_DIVIDER)-1:0] txCounter = 0;

always @(posedge clk) begin
    // RX Clock generation
    if (rxCounter == RX_DIVIDER - 1) begin
        rxCounter <= 0;
        rxClk <= ~rxClk;
    end else begin
        rxCounter <= rxCounter + 1;
    end

    // TX Clock generation
    if (txCounter == TX_DIVIDER - 1) begin
        txCounter <= 0;
        txClk <= ~txClk;
    end else begin
        txCounter <= txCounter + 1;
    end
end
```

endmodule

module Uart8Receiver #(
parameter CLOCK_RATE = 100000000,

parameter BAUD_RATE = 9600,
parameter RX_OVERSAMPLE_RATE = 16
)(
input wire clk,
input wire en,
input wire in,
output reg busy,
output reg done,
output reg err,
output reg [7:0] out
);

```
// Instantiate the BaudRateGenerator for generating the RX clock
wire rxClk;
BaudRateGenerator #(
    .CLOCK_RATE(CLOCK_RATE),
    .BAUD_RATE(BAUD_RATE),
    .RX_OVERSAMPLE_RATE(RX_OVERSAMPLE_RATE)
) baudRateGen (
    .clk(clk),
    .rxClk(rxClk),
    .txClk() // TX clock is unused in the receiver module
);

// State machine states
localparam IDLE       = 2'b00;
localparam START_BIT  = 2'b01;
localparam DATA_BITS  = 2'b10;
localparam STOP_BIT   = 2'b11;

reg [1:0] state = IDLE;
reg [3:0] bitIndex = 0; // Track received bits (8 data bits)
reg [7:0] shiftReg = 8'b0; // Shift register for data reception

always @(posedge rxClk) begin
    if (!en) begin
        // Reset state when disabled
        state <= IDLE;
        busy <= 0;
        done <= 0;
        err <= 0;
        bitIndex <= 0;
        shiftReg <= 8'b0;
    end else begin
        case (state)
            IDLE: begin
                done <= 0; // Clear done flag in IDLE state
                err <= 0; // Clear error flag in IDLE state
                if (!in) begin // Detect start bit (low signal)
                    state <= START_BIT;
                    busy <= 1; // Indicate busy during reception process
                end
            end
```

```
            START_BIT: begin
                if (in) begin // Error if start bit is not held low long enough
                    state <= IDLE;
                    busy <= 0;
                    err <= 1; // Set error flag for invalid start bit
                end else begin
                    state <= DATA_BITS; // Move to data reception phase after valid start
                    bitIndex <= 0; // Reset bit index for data reception
                end
            end

            DATA_BITS: begin
                shiftReg[bitIndex] <= in; // Shift received bit into shift register
                bitIndex <= bitIndex + 1;

                if (bitIndex == 7) begin // All data bits received?
                    state <= STOP_BIT; // Move to stop bit phase after receiving all data
                end
            end

            STOP_BIT: begin
                if (!in) begin // Error if stop bit is not high signal
                    err <= 1; // Set error flag for invalid stop bit
                end else begin
                    out <= shiftReg; // Output received byte on successful reception
                    done <= 1;       // Indicate successful reception completion via done
                end

                state <= IDLE; // Return to idle state after stop bit phase completes
                busy <= 0;     // Clear busy flag as reception process ends here.
            end

            default: state <= IDLE; // Default case to reset to idle state on unexpected
        endcase
    end
end
```

endmodule

Please include the previous module(s) in your response and use them to hierarchically generate a Transmitter defined as:
module Uart8Transmitter #(
parameter TURBO_FRAMES = 0
)(
input wire clk,
input wire en,
input wire start,
input wire [7:0] in,
output reg busy,
output reg done,
output reg out
)

//Insert code here
endmodule

```
module BaudRateGenerator #(
    parameter CLOCK_RATE         = 100000000,
    parameter BAUD_RATE          = 9600,
    parameter RX_OVERSAMPLE_RATE = 16
)(
    input wire clk,
    output reg rxClk,
    output reg txClk
);

    // Calculate clock dividers
    localparam RX_DIVIDER = CLOCK_RATE / (BAUD_RATE * RX_OVERSAMPLE_RATE);
    localparam TX_DIVIDER = CLOCK_RATE / BAUD_RATE;

    // Counters for clock generation
    reg [$clog2(RX_DIVIDER)-1:0] rxCounter = 0;
    reg [$clog2(TX_DIVIDER)-1:0] txCounter = 0;
